No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                             1 atgittaagittaaaaagaa.......tocigoicaagigoitagag 180

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

the invention relates to an Escherichia coli producing and secreting human granulocyte colony stimulating factor (hd-CSF), more specifically, to a recombinant plasmid constructed to express secretory hd-CSF in E. coli, an E. coli transformed with that plasmid to secrete hd-CSF, and a prodess for preparing hd-CSF using the transformed hd-CSF. The crecombinant plasmid vector comprises of a kananycin resistence gene, a promoter, an endoxylanase signal sequence, a mucleotide sequence coding for an oligopeptide consisting of 13 amino acids including 6 consecutive histidine residues and a hd-CSF. B.coli transformed with recombinant plasmid vector is useful for preparing hd-CSF. The method comprises culturing the microorganism to obtain a hd-CSF fusion protein and tracture protein with a protease preferably Factor Xa, to obtain a hd-CSF, where the fusion protein is obtained from the culture by employing Ni-column. The present sequence is a DNA encoding human hd-CSF NI-terminal region inserted into plasmid pTHSCSFMII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AGGACTCCGTTAGGTCCAGCCAGCTCCCTGCCCCAGAGCTTCCTGCTCAAGTGCTTAGAG 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              also describes an endo-bece. It also becent in the framework in the specification also describes a mutant xylanase in the wheat flour. The specification also describes a mutant xylanase from wheat flour. The specification also describes a mutant xylanase protein. The xylanase is useful for preparing a foodstuff, preferably a product. Wild type xylanase or mutant xylanase is useful for preparing a dought hat is less sticky than a dough comprising a fungal xylanase. The xylanase inhibitor is useful for screening high degree resistance xylanases for dough preparation. The xylanase is also useful for spreparing a long preparation of xylanase and the inhibitor is useful for calibrating and/or determining the quantity of inhibitor in a wheat flour sample

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an Bscherichia coli producing and secreting human granulocyte colony stimulating factor (hG-CSE), more specifically, how a recombinant plasmid constructed to express secretory hG-CSF in E-coli, an E-coli transformed with that plasmid to secrete hG-CSF, and a process for preparing hG-CSF using the transformed hG-CSF. The recombinant plasmid vector comprises of a kanamycin resistance gene, a promoter, an endoxylanase signal sequence, a nucleotide sequence coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant plasmid vector comprising an endoxylanase signal sequence, human granulocyte colony stimulating factor gene and other components, when transformed into microorganism useful for preparing the colony stimulating factor.

ä
for an oligopeptide consisting of 13 amino acids including 6 consecutive histidine residues and a hG-CSF. B.coli transformed with recombinant plasmid vector is useful for preparing hG-CSF. The method comprises culturing the microorganism to obtain a hG-CSF fusion protein and treating the fusion protein with a protease preferably Factor Xa, to obtain a hG-CSF, where the fusion protein is obtained from the culture by employing Ni-column. The present sequence is a DNA encoding human hG-CSF
                                                                                                                                                                                                                                                                                         ATGITITCTGCAACCGCCTCTGCAGCTGGCCCGCACCATCACCATCACCATATCGAGGGA 120

is obtained from wheat flour. The specification also describes a mutant xylanase protein. The xylanase is useful for preparing a foodstuff, preferably a bakery product or a substance (e.g. a dough) for making the bakery product. Wild type xylanase or mutant xylanase is useful for preparing a dough that is less sticky than a dough comprising a fungal xylanase. The xylanase inhibitor is useful for screening high degree resistance xylanases for dough preparation. The xylanase is also useful for preparing a non-sticky dough. A combination of xylanase and the inhibitor is useful for callibrating and/or determining the quantity of inhibitor in a wheat flour sample
                                                                                                                                                                                                                                                                                                        9

alkalophilicity, or thermostability relative to naturally occurring B. circulans xylansse, and has at least 5 amino acid substitutions. A bleaching agent comprising a modified xylansse is useful for bleaching pulp, in the bioconversion of lignocellulosic materials to fuels, for clarifying juice and wine, extracting coffee, plant oils and starch, producing food thickeners, altering texture in bakery products, e.g. improving the quality of dough, helping bread to rise and processing of wheat and corn for starch production, use as animal food additives to aid in the digestibility of feedstuffs and in the washing of super precision devices and semiconductors. The present sequence is a coding sequence of a xylanase protein described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                        451

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   510
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for producing recombinant human granulocyte colony stimulating factor (FnG-CSF). The method includes the following steps: (a) reverse transcription-polymerase chain reaction of the human granulocyte colony stimulating factor gene; (b) transforming Escherichia coli, (c) renaturation of protein by hollow fibre ultrafiltration dialysis; (d) passing the renatured protein through ion exchange chromatography, hydrophobic chromatography and molecular sieve
                                                                                                                                                                                                                                                                                                                                                                                                                                           61 ATGITITUTGCAACCGCCTCTGCAGCTGGCCCGCACCATCACCATCACCATATCGAGGG 119

A new fusion protein is disclosed which has the formula R1-L-R2, R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, where R1 is a mutant or variant of human cartebusin-3 (h1L-3), R2 is a second colony stimulating factor (CSF) including cytokine, lymphokine, interleukin, haematopoietic growth factor or IL-3 variant and L is a linker. Generic sequences are described in ARN9228-R79335 and specifically claimed examples are shown in AAR7928-R79342. The fusion protein is made by recombinant DNA techniques. Specifically claimed examples of DNA recombinant DNA techniques. Specifically claimed examples of DNA recombinant DNA techniques. Specifically claimed examples of DNA AR79222-Q97227. The fusion protein is used to increase haematopoietic claimed examples of DNA argonator or antibodies useful in immunoassays and immunotherapy. Antagonists are used to block the growth of certain cancer cells and in treatment of asthma. The fusion protein can also be used to stimulate bone marrow and blood cell activation and growth in vitro before infusion; and to treat diseases characterised by decreased levels of myeloid, erythroid, lymphoid and/or megakaryocyte cells of the haematopoietic system. The protein has the usual activity of both its component proteins, but may have increased synergistic activity and reduced undesired side effects
                                                                                                                                                 ö

This invention relates to a novel variant xylanase protein or its fragment having xylanase activity. The variants have one or more amino caid modifications so that the protein or fragment has an altered consistency to a xylanase inhibitor and has an altered thermosensitivity as ensitivity to a xylanase inhibitor and has an altered thermosensitivity as compared with a parent xylanase enzyme. The variant xylanases of the invention are useful for degrading or modifying a plant cell wall, and for processing cereals, starch production, in processing wood, and enhancing the blacking of wood pulp. They may also be useful for a variety of applications such as animal feed, flour separation (wetmilling) and paper of lour dough. The enzymes of the invention may alter or reduce the resonance of the invention may alter or reduce the viscosity derived from the presence of hemicellulose or arabinoxylan in a colution or system comprising plant cell wall material, and for modifying codard/or feed supplement comprising xylan. Use of the variant contraint processes improves the properties of flour based doughs and products made from the doughs. The baked products have highly desirable characteristics with respect to blood volume, crumb structure and appearance and additionally have an extended shelf-life. The enzymes of the invention have reduced thermosensitivity and inhibitor and products and additionally have an extended shelf-life xylanase required for animal feed, starch production in the amount of xylanase required the construction and baking. The present sequence is the column and paking. The present sequence is
                                              Novel variant xylanase polypeptide having altered sensitivity to a xylanase inhibitor and altered thermosensitivity as compared with a parent xylanase enzyme, useful in baking, processing cereals, starch
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which was used to create the variant xylanases of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 79; DB 9; Length 645;

The present invention relates to a non-naturally occurring xylanase activity (XA) protein comprising an amino acid sequence less than 97% identical to a naturally occurring Bacillus circulans xylanase, where the Novel xylanase activity protein, useful in bleaching process of pulp and in food and animal feed industry, has enhanced thermostability and Disclosure; Fig 1C; 121pp; English. alkalophilicity.

                                                                                                                                              The present sequence is given in a specification relating to non naturally occurring xylanase activity (XA) proteins. The XA proteins comprise an amino acid sequence less than 97% identical to a naturally occurring Bacillus circulans xylanase. They are modified to exhibit enhanced thermophilicity, alkalophilicity or thermostability relative to the naturally occurring B. circulans xylanase. They may be used as the active compound in a bleaching agent which is used for bleaching pulp
                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                        119
                                                              Non naturally occurring XA protein with enhanced thermophilicity, alkalophilicity or thermostability relative to the naturally occurring Bacillus circulans xylanase is used in an agent for bleaching pulp.

                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                d
                                                       also describes an endo-beta-1,4-xylanase inhibitor, which is obtained from wheat flour. The specification also describes a mutant xylanase protein. The xylanase is useful for preparing a foodstuff, preferably a bakery product or a substance (e.g. a dough) for making the bakery product. Whid type xylanase or mutant xylanase is useful for preparing a dough that is less sticky than a dough comprising a fungal xylanase. The xylanase is useful for screening high degree resistance xylanase for dough preparation. The xylanase is also useful for preparing a preparation and/or determining the quantity of inhibitor in the set of the constitution of the inhibitor in the set of the constitution of the inhibitor in the xylanase and the inhibitor in the xylanase and the inhibitor in the xylanase and the inhibitor in the xylanase and the similar and/or determining the quantity of inhibitor in

The invention relates to a variant xylanase polypeptide (I) or its fragment having xylanase activity, comprising one or more amino acid modifications such that (I) or its fragment has an altered sensitivity to a xylanase inhibitor as compared with the parent xylanase enzyme. (I) or its coding sequence (II) is useful for degrading or modifying plant cell wall or for processing a plant material by contacting the plant cell wall or plant material with (I) or (II): (I) is useful for modifying plant materials, and in baking, processing cereals, starch production, processing wood and enhancing the bleaching of wood pulp. (I) is useful or altering the viscosity derived from the presence of hemicellulose or arabinoxylan in a solution or system comprising plant cell wall material.

(I) is useful for preparing a foodstuff such as bread, pretzels, tortillas, cakes, cookies, biscuits or crackers. The present sequence represents the coding sequence of Bacillus subtilis xylanase as described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                63

          specification also describes an endo-beta-1,4-xylanase inhibitor, which is obtained from wheat flour. The specification also describes a mutant sylanase protein. The xylanase is useful for preparing a foodstuff, preferably a bakery product or a substance (e.g. a dough) for making the bakery product. Wild type xylanase or mutant xylanase is useful for preparing a dough that is less sticky than a dough comprising a fungal xylanase. The xylanase inhibitor is useful for screening high degree resistance xylanases for dough preparation. The xylanase is also useful for preparing a non-sticky dough. A combination of xylanase and the inhibitor is useful for calibrating and/or determining the quantity of inhibitor in a wheat flour sample

The present sequence encodes a mutant endo-beta-1,4-xylanase. The specification also describes an endo-beta-1,4-xylanase inhibitor, which is obtained from wheat flour. The specification also describes a mutant xylanase protein. The xylanase is useful for preparing a foodstuff, preferably a bakery product or a substance (e.g. a dough) for making the bakery product. Wild type xylanase or mutant xylanase is useful for preparing a dough that is less suicky than a dough comprising a fungal xylanase. The xylanase inhibitor is useful for screening high degree for preparing a non-sticky dough. A combination of xylanase and the inhibitor is useful for allorable and continuing the quantity of inhibitor in a wheat flour sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Vector: pbrive Cloning Vector; RT-PCR was performed using gene-specific primers flanking the open-reading frame. PCR products were subcloned into pbrive Cloning Vector and sequenced completely using M13 forward and reverse primers. Sequencing gaps were closed by re-sequencing using primers flanking the gapped areas."
